Frontend Developer Internship — Updated Submission Report

Reference & approach

The supplied assignment requires a from-scratch Next.js/React landing page with responsive behavior, meaningful interactions, clean component structure, at least three meaningful improvements and a short problem-solving report. This submission follows that brief with original React/TypeScript/CSS structure.

Part A — What did I improve?

Improvement	Problem	Solution / Why it is better
1. Premium visual hierarchy	The experience can feel generic when typography, spacing and CTA hierarchy are treated uniformly.	Introduced an editorial design system with display typography, restrained gold accents, layered hero treatment, glass card styling and a more deliberate spacing rhythm.
2. Conversion flow	Important enquiry actions can disappear inside a long property landing page.	Strengthened the hero visit CTA, added a focused private-enquiry card and repeated contextual actions without making the page feel sales-heavy.
3. Responsive polish	Large grids, navigation and typography can become cramped at smaller widths.	Added purposeful mobile/tablet breakpoints, fluid type, grid-to-stack transitions, touch-friendly navigation and simplified mobile compositions.
4. Accessibility & feedback	Interactive controls and forms need clear states and usable keyboard behavior.	Added semantic sections, labelled form fields, validation feedback, ARIA menu state, visible focus treatment and reduced-motion support.

Part B — What was the hardest part?

Challenge: Making a visually rich real-estate landing page responsive without turning each section into a one-off layout.

Why it was difficult: The page combines a large hero, multiple card grids, interactive tabs, a gallery, location content and a long enquiry flow. These elements need different behavior at 375px, 768px and desktop widths.

What I tried: I separated the page into reusable components first, then established the desktop composition and layered responsive rules around those reusable structures.

Final solution: The CSS uses a small number of purposeful breakpoints, fluid typography with clamp(), grid-to-stack transitions, touch-friendly controls and reduced-motion support.

Part C — What would I do next?

- Lead management backend — connect the enquiry form to an API/database so sales teams can receive and track leads.
- CMS integration — let marketing teams update amenities, plans, gallery imagery and FAQs without code changes.
- Analytics & conversion tracking — measure CTA clicks, form starts, submissions and gallery engagement.
- SEO & performance pass — add structured data, optimize local imagery and run deeper Core Web Vitals testing.

- Production integrations — connect verified project data, brochure downloads, map/location data and a secure admin workflow.

Implementation summary

Technology: Next.js App Router, React, TypeScript, Node.js/npm, CSS and lucide-react. Components are separated by page section. Interactions include a scroll-aware responsive navigation, plan tabs, gallery lightbox, validated enquiry form and map link. The submission ZIP excludes node_modules and .next.
